November 24th, 2018 - The blades of leaves of many pitcher plants are flattened and have a cone shaped or vaselike look. The pitcher leaves have nectar secreting glands that produce an odor to attract insects that often fall into a watery fluid at the bottom and get stuck.

Gene control of flowering time in higher plants

SpringerLink

April 14th, 2019 - Expression of the genes related to flowering is the foundation for achieving the transition. Environmental factors such as vernalization and photoperiod and the growth status of cell itself induce the expression of the specific genes. A lot of achievements have been made recently in gene control for the determination of flowering time.

Melatonin and plants

Journal of Experimental Botany

April 9th, 2019 - Chloroplasts are believed to be a primary site of melatonin production. The SNAT has been localized in chloroplasts of the rice plant Byeon et al. 2014. This is not surprising since cyanobacteria are considered to be the precursors of chloroplasts and these organisms already have the capacity to synthesize melatonin Tan et al. 2013.

Orchid Programs Marie Selby Botanical Gardens

April 15th, 2019 - The Orchidaceae is one of the largest families of flowering plants and contains over 25,000 species found nearly the world over. Orchids are most diverse in the tropics and reach their highest diversity in Andean South America. As many as 70 of orchids are epiphytic and are of particular interest to Selby Gardens where the study and conservation of epiphytic plant groups is our mission.

Agave Wikipedia

April 15th, 2019 - The succulent leaves of most Agave species have sharp marginal teeth, an extremely sharp terminal spine, and are very fibrous inside. The stout stem is usually extremely short which may make the plant appear as though it is stemless. Agave rosettes are mostly monocarpic though some species are polycarpic, page needed. During flowering a tall stem or mast quiote in Mexico grows.
